

STOP INFECTIONS AFTER SURGERY

WHAT'S THE PROBLEM?

Patients develop infections when **bacteria get into incisions made during surgery**. These affect patients in both...

LOW- AND MIDDLE-INCOME COUNTRIES

More than **1 in 10 people** who have surgery in low- and middle-income countries (LMICs) get **surgical site infections (SSIs)**

People's risk of SSI in LMICs is **3 TO 5 TIMES HIGHER** than in high-income countries

Up to **1 in 5 women** in Africa who deliver their baby by caesarean section get a **wound infection**

HIGH-INCOME COUNTRIES

In Europe, SSIs affect more than **500 000 PEOPLE** per year costing up to **€ 19 BILLION**

Around **1%** of people who have surgery in the **USA** get an SSI

In the USA, SSIs contribute to patients spending more than **400 000 extra days** in hospital, costing **US\$ 10 BILLION** per year

SSIs can be caused by bacteria that are **resistant to commonly-used antibiotics**

SSIs threaten the lives of **millions** of surgical patients **each year** and contribute to the spread of **antibiotic resistance**

WHAT'S THE SOLUTION?

A range of precautions - **before, during and after surgery** - reduces the risk of infection

BEFORE SURGERY

Ensure patients bathe or shower

Do not shave patients

Only use antibiotics when recommended

Use chlorhexidine alcohol-based antiseptic solutions to prepare skin

Surgical scrub technique: hand wash or alcohol-based handrub

DURING SURGERY

Limit the number of people and doors being opened

Ensure all surgical equipment is sterile and maintain asepsis throughout surgery

AFTER SURGERY

Do not continue antibiotics to prevent infection - **this is unnecessary and contributes to the spread of antibiotic resistance**

Check wounds for infection and use standard dressings on primary wounds

Correct use of antibiotics and surgical techniques help **stop the spread of antibiotic resistance**

Preventative measures can **reduce SSIs by 39%** (as shown in a pilot study in 4 African countries)

SSI surveillance needs to be an integral part of programmes to prevent infections

Team work, good communication and staff engagement support SSI prevention

WHO's Global Guidelines for the Prevention of Surgical Site Infections provide recommendations for the care of patients before, during and after surgery. For more information visit www.who.int/gpsc/en
